## Paths

+ add path

search for paths...

What is a computer

Using a web browser

Browsing housing sites

Using your smartphone

Using this platform

The keyboard

# Weekly checklist

## I can

- create a path
- update a path's title
- delete a path
- get all existing paths and display them properly on the page
- search paths on the page (search by title, case insensitive)
- click on a path to see **that path's modules** (not all modules)
- display paths in a way that matches my current styles

## Bonus

- I can duplicate a path by providing a new title - which makes a **copy** of its modules (not its module IDs)
- When I delete a path and its modules are not used in another path, they are deleted from the database (cleanup duty)
- Loaders loaders loaders
